## SERVICE MANUAL

MODEL

**DD-5 A/B/C/E/J/U**

STEREO CASSETTE DECK

No. 4197  
January 1981

## Features

- Pulse-servo direct drive/Two-motor full logic operation mechanism
- Low wow/flutter (WRMS 0.021%)
- Two-color long scale FL digital display peak meter with hold
- Sen-Alloy record/playback head
- ANRS/DOLBY B and Super ANRS incorporated
- Metal tape compatible
- New slim design with push button switches
- Auto-rewind PLAY/STOP
- Remote control facility (R-50E, option)
- Record muting (REC MUTE) mechanism (with operation indicator LED)
- Timer standby facility with safety lock
- Output volume with headphone volume

## Controls and Connections

# Description on technology

For the following technology, refer to "Description on new technology" of DD-7A/B/C/E/J/U service manual (No. 4195).

## ■ Direct Drive (D. D.) motor

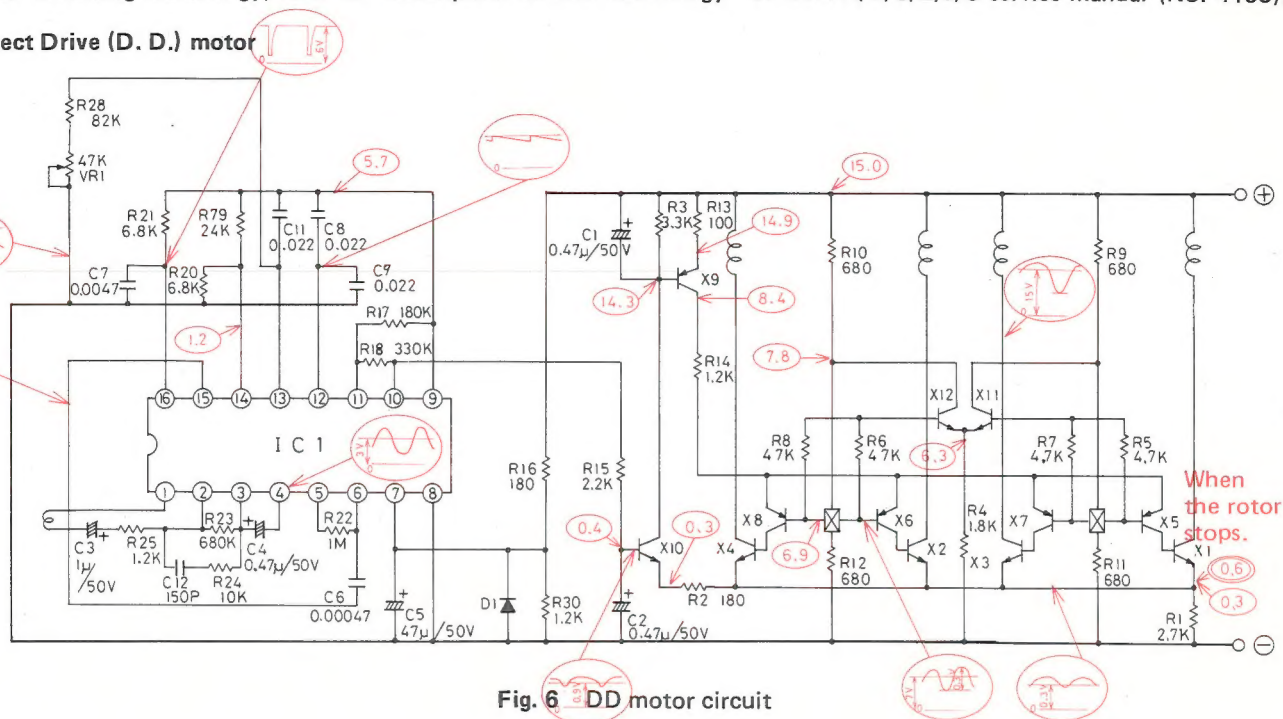

Fig. 6 DD motor circuit

Fig. 7 DD motor block diagram

Other functions not written here are the same as those of DD-7A/B/C/E/J/U.

- Two-solenoid mechanism with real-time pause function.
- FL level meter circuit.

## Maintenance

To get long, trouble-free service, maintenance is important. Do not forget cleaning and demagnetizing.

### Cleaning

After long use, the heads and tape part — capstan, pinch roller, etc. — will become dirty with dust or magnetic particles. Dirty heads cause imperfect erasing or high frequency drop-off. A dirty capstan and pinch roller will cause unstable tape speed, leading to increased wow and flutter. Always keep them clean by following the procedure below.

#### 1. Heads

- 1) Push Eject button to open the cassette holder.
- 2) Use the head cleaning stick provided to wipe the surface where the tape comes into contact with the head.  
(It is effective to moisten the cotton with alcohol.)

#### 2. Pinch roller and capstan

Do the same method as heads.

#### 3. Cabinet

When the cabinet becomes dirty, wipe it with a soft cloth soaked with a neutral cleaning solution of a polishing cloth.

\* Do not use thinner or benzene.

### Demagnetizing

The heads are made from a material resistant to magnetization, but after long use they may become magnetized. A magnet brought into their vicinity can magnetize the heads, causing excess noise. If noise seems to have increased, demagnetize the heads with a head demagnetizer through the following procedure.

1. Turn the POWER switch OFF.
2. Wrap the tip of the demagnetizer with vinyl tape or soft cloth so as not to damage the head surface. Switch on the demagnetizer and bring it close to the head.
3. Move the tip of the demagnetizer slowly first to the left and right, then up and down in front of the head. Gradually move it away from the head and switch it off at a distance of more than 30 cm (12").
4. The erase head need not be demagnetized. The capstan shaft and tape guide should be demagnetized in the same way as the record/playback head.

\* Do not bring a magnetized metallic object (a screwdriver, for example) near the head as this will increase noise.

## Removal of the main parts

Observe care in handling the parts since the parts are small in size and the distance between them are short due to a

deck design aimed mainly at compactness and high performance.

Fig. 8

### ENCLOSURE ASSEMBLY PARTS

- **Cassette door**  
Push the eject button to open the cassette door.  
Slide off the cassette door upwards (about 5 mm) to unlock its pawls of both sides.  
Remove the cassette door forward.
- **Input level control knobs (Right channel & Left channel)**  
Pull off them forward.
- **Top cover**  
Remove 5 screws ① (left and right ..... 2 screws on each and rear center ..... a screw).
- **Bottom cover**  
Remove 6 screws ② fastening the bottom cover.
- **Front plate assembly**  
Remove 5 screws ③ (blue 2 screws for the mechanical assembly, and other screws are under rubber cushions) on upper side and 2 screws on bottom side fastening the front plate assembly.

Fig. 9

## ELECTRICAL PARTS

- **Power switch**  
Remove 3 screws ④ fastening the switch bracket.  
Remove 2 screws ⑤ fastening the power switch.
- **Power transformer**  
Remove 4 screws ⑥ fastening the power transformer.
- **Main P.W.B. assembly**
  - 1) Remove 2 screws ⑦ fastening the switch.
  - 2) Remove 4 screws ⑧ fastening the main P.W. board.
  - 3) Remove 2 screws ⑨ fastening the heat sink plate for transistors.
  - 4) Remove 2 screws fastening the escutcheon for pin jacks.
  - 5) Remove 2 connectors (on the main P.W. board) of REC/PB head wires and erase head wires.
  - 6) Cut off 4 clamps (QHX2075-001) for wires.
- **FL P.W. board assembly**  
After removing the front plate assembly, remove the connector of wires, and pull off them forwards.

## MECHANICAL ASSEMBLY

- **Timer standby switch**
  - 1) Remove the timer switch knob.
  - 2) Remove 2 screws, moving the bracket up or down.
- **MECHANICAL ASSEMBLY**
  - 1) Remove a screw ⑩ fastening the arm of gear-oiled damper (left side of cassette holder).  
To remove the door brake relational parts, remove 2 screws ⑪ fastening the gear frame assembly.
  - 2) Remove 4 screws ⑫ fastening the mecha. bracket to amp chassis. (Left and right ..... 2 screws on each)
  - 3) Remove a screw fastening the front panel.
  - 4) Remove 3 wires from chassis.
  - 5) Remove 5 connectors on the mecha. control P.W. board.

### Mechanical section mounting

To mount the entire mechanical section, insert the tops (2 places) of the mounting bracket into the groove in the front bracket (molding).

**Note:** When the tops of the mounting bracket is placed in the lowest side of the front bracket, even if the screw is tightened, unstable mounting results.

Fig. 10

### MECHANICAL PARTS

Fig. 11

Fig. 12

Fig. 13

#### 1. Supply reel disc

Pull out the reel disc stopper ① and remove its disc from the shaft.

When assembling the reel disc, the stopper needs a new parts (the stopper cannot be used again).

#### 2. Reel motor

- 1) Remove 3 screws ② fastening the reel motor.
- 2) Remove a screw fastening the shift arm.

#### 3. Take-up reel disc

Pull out the reel disc stopper ③.

#### 4. Erase head

Remove a screw ④ for adjustment.

Remove a screw ⑤.

#### 5. REC/PB head

Remove a screw ⑥ for adjustment.

Remove a screw ⑦.

#### 6. Pinch roller arm ass'y

Remove an E-ring ⑧ holding its assembly.

#### 7. Capstan motor assembly

1) To remove the mecha. control P.W. board ass'y, remove a screw ⑨ fastening its assembly.

2) Remove a screw ⑩ fastening the earth lug (with removing the shield barcket).

3) Remove 4 screws ⑪ fastening the solenoid bracket.

4) Remove 4 screws ⑫ fastening the capstan motor assembly.

# Main Adjustments

## [I] Equipment and measuring instruments used for adjustment

### 1. Electrical adjustment

- 1) Electronic voltmeter
- 2) Audio frequency oscillator  
(range: 50–20 kHz and output 0 dB with impedance 600  $\Omega$ )
- 3) Attenuator
- 4) Standard tapes for REC/PB
 

Maxell UD – SF tape	} or equivalent
TDK SA – SA tape	
SCOTCH METAFINE – Metal tape	
- 5) Reference tapes for playback (JVC Test Tape)
  - VTT-658 (for head azimuth adj.)
  - VTT-656A-S (for motor speed, wow flutter adj.)
  - VTT-664 (for Reference Level 1 kHz)
  - VTT-675N (for playback frequency response)
- 6) Resistors
  - 600  $\Omega$  (for attenuator matching)

DD-5

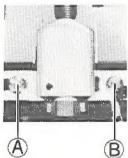

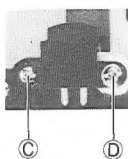

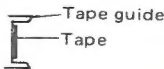

Fig. 14

### 2. Mechanical adjustment

- 1) Torque testing cassette gauge
- 2) Blank tape (C-120) for tape running checker

## [II] Adjustment and repair of the mechanism

(Adjust the mechanism or confirm that it is in normal operating condition prior to the adjustment of the electrical circuit.)

Item	Adjustment	Adjusting point	Standard value	Remarks
Adjusting record/playback head position 	<ol style="list-style-type: none"> <li>1. Connect an electronic voltmeter to the LINE OUT terminals.</li> <li>2. Play back the VTT-658 test tape.</li> <li>3. Adjust the head angle with the screw (A) until the reading of the electronic voltmeter becomes maximum for both channels.</li> <li>4. After adjusting, set the screw with screw bond.</li> </ol>	Screw (A)	Maximum	If the head is worn, disconnected or exceedingly magnetized so as not to provide the necessary characteristics, replace it with a new one. After replacement, the head position adjustment as well as the playback level adjustment, the bias current adjustment and the recording level adjustment are all necessary. If the output difference between the left and right channels exceeds 3 – 4 dB, the head is defective. Replace it with a new one.
Adjusting erase head height 	Employ a special cassette (C-120) from which parts of the casing, where the erase head, record/playback head and capstan engage, has been cut away. Perform tape transport with the cassette tape. Adjust the screw (C) until the tape runs in the center of the erase head tape guide. <div style="display: flex; justify-content: space-around; align-items: flex-end;"> <div style="text-align: center;"> <p>Correct</p>  </div> <div style="text-align: center;"> <p>Incorrect</p>  </div> </div>	Screw (C)		Be sure to perform this adjustment after replacing the erase head.

**Tape-to-head contact adjustment**

- 1) Turn the adjusting screw for aligning the erase head until it stops. Then, turn the screw in the reverse direction by 225° (a 5/8 revolution).
- 2) Check the tape-to-head contact using a C-120 tape having pads.
- 3) Check it again with a Metal tape.  
Checking method:  
Record a 400 Hz or 1 kHz signal with 0 VU + 20 dB. Erase the recording. Checking if the erasing is satisfactorily performed.
- 4) After adjustment, apply screw bond on the adjusting screw to prevent its loosening.

Semi-fixed resistor for motor speed adjustment

Fig. 15

Item	Adjustment	Adjusting point	Standard value	Remarks
Adjusting motor speed	Connect a speed meter (an electronic counter) to the LINE OUT terminals. Play back the VTT-656A-S test tape. Adjust the semi-fixed resistor on the motor P.W. board until the reading of the speed meter is 3000 Hz.	Semi-fixed resistor on the motor P.W. board	3000 Hz	If the speed meter functions as a wow and flutter meter, also, connect the deck to the INPUT terminals of the meter.
Checking play-back torque	Employ a torque testing cassette tape for the checking.		40–70 gr-cm	If the standard torque is not obtained, replace the take-up disc assembly.
Checking fast forward torque	Measure the torque in the fast forward mode in the same manner as in the above.		More than 80 gr-cm	If the standard torque is not obtained, perform the following. 1. Clean the capstan belt, the motor pulley, the take-up reel disc circumference, the flywheel circumference, etc. 2. Replace the belt.
Checking rewind torque	Measure the torque in the rewind mode in the same manner as in the above.		More than 80 gr-cm	If the standard torque is not obtained, clean the capstan belt, motor pulley, flywheel circumference, left reel disc circumference, etc.
Checking wow and flutter	Connect a wow and flutter meter to LINE OUT terminals. Play back the VTT-656A-S test tape. Check to see if the reading of the meter is within 0.03% (WRMS).			If the reading becomes moving value even if conforming to the standard, a re-claim may be raised. Repairs are necessary.

### [III] Adjustment location of electrical circuit

#### ■ Main amp. P.W. board (Parts Ass'y side view)

#### ■ FL P.W. board (Parts Ass'y side view)

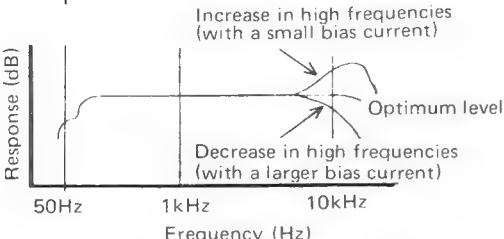

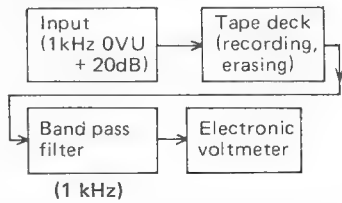

Fig. 16

### [IV] Electrical circuit adjustment procedure

In the steps marked by an asterisk (\*), adjustment should be performed, however, only checking is sufficient with steps other than those.

Adjustment should be performed in the order of steps 1, 2, 3, . . . Perform this adjustment with the ANRS switch set to OFF and output level control set to maximum.

Step	Item	Adjustment	Adjusting point	Standard value	Remarks
1*	Adjusting playback level	1. Play back the VTT-664 Reference tape (1 kHz) with the tape select switch set to the SF/NORM position. 2. Adjust VR102 and VR202 until the LINE OUT becomes about -4 dBs.	VR102, 202	-4 dBs (0.5 V)	This adjustment becomes necessary when a change in playback level results (for example, due to head replacement).
2*	Playback frequency response	Playback test tape VTT-675N (1 kHz, 10 kHz) for following adjustment. 1) Adjust VR101 and VR201 so that 10 kHz signal and 1 kHz signal gains become flat response.	VR101, 201	Reference frequency; 1 kHz 0 ± 2 dB at 10 kHz	TAPE SELECT; SF/NORM
3*	FL (Fluorescence Level) indicator sensitivity	1) Make a short-circuit between the two check pins (HOLD-OFF) on the FL meter board using a clip or the like to cancel the peak-hold function. 2) Put the set into the record mode, then apply a 1 kHz signal of around -20 dB to the R-ch and L-ch of the LINE IN terminals. 3) Adjust the INPUT LEVEL control so that the output level at the LINE OUT terminals is -4 dB. 4) Adjust VR701 (0 VU ADJ) so that "0" dB lights on both R and L. At this time, "0" dB must go out on both R and L with the input ATT (attenuation) level lowered by 0.5 dB. 5) Lower the input ATT level by 20 dB. 6) Adjust VR501 (L-ch) and VR601 (R-ch) so that "-20" dB lights on both R and L. At this time, "-20" dB must go out on both R and L with the input ATT level lowered by 1 dB. 7) Repeat steps 4) - 6).	VR701, 601	0 VU -20 VU	This adjustment becomes necessary due to parts replacement.

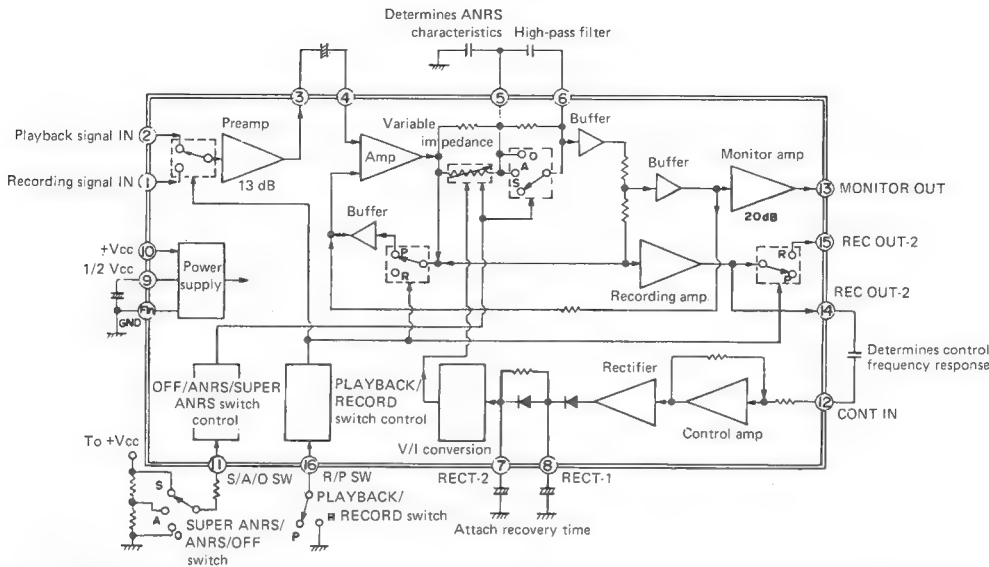

Step	Item	Adjustment	Adjusting point	Standard value	Remarks
4*	Checking record/playback frequency response	<p>Record 1 kHz, 50 Hz and 12.5 kHz signals at an input level of 0 VU to -20 dB. Play back the tape. Check to see that the 50 Hz and 12.5 kHz signal output deviations fall within the standard range, using the 1 kHz signal output as a reference.</p>  <p>The graph shows a flat response line at 0 dB between 50 Hz and 10 kHz. An arrow points to the 10 kHz end of the line with the text 'Increase in high frequencies (with a small bias current)'. Another arrow points to the 10 kHz end of the line with the text 'Decrease in high frequencies (with a larger bias current)'. The line is labeled 'Optimum level'.</p>	<p>For SF/NORM tape; VR106, 206</p> <p>For SA/CrO<sub>2</sub> tape; VR107, 207</p> <p>For Metal tape; VR108, 208</p>	<p>Reference frequency; 1 kHz</p> <p>0 ± 3 dB at 50 Hz</p> <p>0 ± 3 dB at 12.5 kHz</p>	<p>This checking should be performed for normal, chrome and metal tapes and for both right and left channels.</p> <p>1. Bias current adjustment for a cassette deck should generally be performed referring to the record/playback frequency response. This is because the frequency response of a cassette deck depends more greatly upon the bias current than does that of an open reel deck.</p> <p>The current measuring method described below is an alternative one.</p> <p>2. If the bias current is not properly adjusted, the record and playback characteristics become as shown left.</p>
5	Adjusting recording level	<p>1. Apply a 1 kHz, approx. -10 dB signal to the LINE IN terminals. Adjust the recording level controls until the signal is available at -4 dBs at the LINE OUT terminals.</p> <p>2. After checking to see if the FL indicator become 0, record the signal applied to both left and right channels using normal tape.</p> <p>3. Play back the recording part. Perform the recording signal adjustment with VR105 and VR205 so that the FL indicator become 0.</p>	VR105, 205	0 VU	<p>The level difference between left and right channels for SF/NORM tape, chrome tape and metal tape should be less than 1 dB (1 VU). Perform the adjustment using a normal tape, level difference between recording and playback for SA/CrO<sub>2</sub> and metal tapes, should be less than 1.5 dB, and that between left and right channels should also be less than 1 dB.</p>
6	Checking record/playback signal distortion	<p>1. Record a 1 kHz, -4 dBs signal to LINE IN terminals and perform recording with the FL indicator become 0.</p> <p>2. Play back the recorded part. Check the output with a distortion meter to see if the value conforms to the standard value.</p>		<p>SF/NORM tape; Less than 2.5%</p> <p>SA/CrO<sub>2</sub> tape; Less than 3%</p> <p>Metal tape; Less than 2%</p>	<p>Be sure to perform this adjustment following bias current and recording level adjustments.</p>
7	Checking signal to noise ratio in recording/playback	<p>1. Record a 1 kHz, 0 VU signal. Stop the input by disconnecting from the terminal to perform non-signal recording.</p> <p>2. Play back the recorded part. Measure the 0VU recording output and the non-signal recording output for comparison using an electronic voltmeter. Check to see if the value conforms to the standard value.</p>		<p>SF/NORM, SA/CrO<sub>2</sub> and Metal tapes; More than 42 dB</p>	<p>Apply an output (-72 dBs) to the MIC terminals with the recording level controls set to maximum so that the FL indicator become 0.</p>
8	Checking erasing coefficient	<p>1. Apply a 1 kHz signal to the LINE IN terminals. Adjust the recording level controls until the FL indicator become 0.</p> <p>2. Perform recording with the signal enhanced by 20 dB.</p> <p>3. Erase a part of the recording.</p> <p>4. Measure the output difference between the erased part and non-erased part to compare with an electronic voltmeter.</p>		More than 65 dB	<p>For the measuring, connect a band pass filter between the deck and the electronic voltmeter.</p>  <p>The diagram shows a signal flow: 'Input (1kHz 0VU + 20dB)' goes into a 'Tape deck (recording, erasing)'. The output of the tape deck goes into a 'Band pass filter (1 kHz)', which then goes into an 'Electronic voltmeter'.</p>

## Supplementary SERVICE MANUAL

### MODEL DD-5 A/B/C/E/J/U

This manual is supplementary of Service Manual (No. 4197) for Model DD-5A/B/C/E/J/U.

The other parts not listed here are the same as those of the service manual (No. 4197).

Please give an order to us for the parts concerned to keep them as spare.

Page 23—25

#### Enclosure Assembly and Electrical Parts List (Except P.W. Board Parts)

⚠ parts are safety assurance parts.  
When replacing those parts, make sure to use the specified one.
